

Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is actually a hydraulic apparatus that could allow the individual driving to be able to control the forklift without leaving the seat. They are made out of top quality materials and are designed to be able to endure the most challenging procedures and work surroundings. Side shifting units have the added ability to be able to laterally position the entire load or the arms in order to facilitate much more precise carrying and position in a faster and much more efficient manner.

The blade pocket is rather unique and can enable the individual operating it to safely sway the blades into position without any fear of destroying the positioning cylinders. This can allow the operator the option to be able to execute simultaneous or independent fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on existing units.
